

The application requires the database be connected (localhost), so be sure that it is connected on mysql.

Before running the .py file (nba.py), make sure to configure the mysql connector to the desired database. The password will be different for each user.

```
mydb = mysql.connector.connect(  
    host="127.0.0.1",  
    user="root",  
    password="CS425SQL!2023",  
    database="nbadb"  
)  
mycursor = mydb.cursor()
```
